## PUT Request

angular.module('myApp', []).

controller('mycontroller', ['\$scope', '\$http', function

(\$scope, \$http)] {

\$scope.formData = {};

\$scope.putFormData = function() {

\$http.put('/api/data/' + \$scope.formData.id -

\$scope.formData).

.then(function(response) {

console.log(response);

});

.catch(function(error) {

console.error(error);

});

});

});

Explanation

→ The ng-submit directive calls the putFormData()

function when the form is submitted

→ The putFormData() function sends a PUT request

to the /api/data/:id endpoint with the ID  
as a path parameter and the form from the data  
as the request-body
